

M2i is an innovation program to develop and apply new and improved materials. The key message of M2i is that high-tech materials are crucial to creating a sustainable society and achieving economic growth. M2i has build up an international network of prominent universities and leading companies to share their knowledge in a public–private partnership within the M2i program.

M2i is working on a broad range of materials with both structural and functional applications. Solutions are being found for the developiment of comfortable, safe, sustainable and user-friendly materials and production processes. We do not stop at a fundamental research project, but also ensure that the results can be applied in the industrial practice of our partners through a process of valorization.
